

Opening of a laboratory complex for the study of optical fibers and cable lines

On the personal initiative of a communications veteran, Yerezhep Sarsembayev, a laboratory office on fiber optics and cable lines was opened at Karaganda Technical University. Thanks to this, university students got the opportunity to see the structure and operation of the modern telecommunications system with their own eyes and gain practical skills even at the training stage. The office is equipped with specially designed stands, each of which includes visual information about a particular technology used by signalmen. This allows students of the Department of Technologies and Communication Systems to have a clear idea about the equipment and technologies used in modern realities.
